

## Recycled plastic

### **Properties**

The recycled plastic material we use is called RETEXTIL.

We use RETEXTIL because it is made from regranulate composed of plastic film and textiles with no additional additives and offers great strength compared with other recycled plastic materials.

RETEXTIL is a material requiring the bare minimum of maintenance, even when used for outdoor furniture that is exposed to rain, fallen leaves, etc.

We use recycled plastic slats in grey and black as standard. Both shades provides a varied, vibrant surface that comes from remelting of granulates and optional addition of pigments. RETEXTIL, like most other materials, will fade over time when exposed to sunlight.

The estimated useful life is at least 30 years. RETEXTIL can subsequently be remelted and recycled again – estimated three times. Visit [retextil.dk](http://retextil.dk) for more information.

### **Use and maintenance**

#### *Use*

- RETEXTIL is basically maintenance-free
- Any damaged plastic slats can be replaced

#### *Cleaning*

- Remove any twigs, leaves and similar using a broom
- Wash down with water and possibly an algae remover – follow the directions on the product
- Finish by rinsing with clean water
