

Acrylic roofs

Properties

Acrylic is also known as plexiglass and is a clear, strong plastic material that is used as an alternative to glass. Compared to glass, acrylic is lighter and more impact resistant, and it has a higher light transmission than glass. It is also easier to process.

Acrylic is sensitive to solvents as well as concentrated acids and bases. Therefore, only use mild detergents. An acrylic sheet can contain stresses that make the sheet fragile. Acrylic will also become brittle over time.

Our acrylic sheets are produced with protection from the sun's UV rays. With regular maintenance, the roof will retain its appearance for up to 30 years.

Operation and maintenance

Cleaning

- Wash with a sponge and soapy water or an acrylic cleaner - follow the instructions on the product
- Rinse with clean water and dry with a washcloth
- Matte areas and scratches can be polished away with a polish intended for acrylic - follow the instructions on the product
- Alcohol and other solvents must not be used on acrylic

End of Life Guide

- Ask your local waste management authority or disposal service for correct recycling or disposal of acrylic roofs
